level access

Tailored tools for developers in the Level Access Platform

Catch issues in development, not production.

Development teams play a critical role in creating accessible products by fixing and maintaining code from inception to production. To support these teams in efficiently delivering accessible code, Level Access offers a comprehensive range of tools and services tailored specifically to developers' needs.

Addressing critical accessibility issues during development has consistently proven to be more cost-effective than addressing them in production. By leveraging Level Access's suite of developer tools, such as the accessibility API, Webhooks, and Testing SDKs, developers can layer accessibility directly into their processes to make accessibility a seamless part of how they write and test code.

Connecting to accessibility

The Level Access Platform offers several ways for developers to integrate accessibility directly into the development pipeline.

Develop and deploy code confidently with Testing SDKs

Identify and resolve accessibility issues before they reach production with our Testing SDKs. The Level Access Testing SDKs seamlessly integrate with popular testing frameworks, making it easy to incorporate automated accessibility testing into your existing suite of UI tests and start catching issues right away. By continuously evaluating the accessibility of specific elements, flows, and pages that are under development, our SDKs can efficiently pinpoint new issues and empower you to address them by providing actionable insights.

Ecosystem integration with Webhooks

Improve collaboration and unlock real-time accessibility insights with Webhooks. Webhooks embed accessibility into your development workflow by sending automatic messages through tools like Slack and Microsoft Teams that notify your team about important updates from the platform. Alternatively, use Webhooks to connect with Zapier and trigger automated workflows that can integrate data with over 5,000 other apps and tools.

Accessibility data anywhere with the Level Access API

Create transparency and improve efficiency by integrating accessibility directly into your key tools, workflows, and reports with the accessibility API. Populate business intelligence dashboards with the latest monitoring score or trigger an automated scan with each new build to make accessibility a seamless part of your process.

Out-of-the-box tools for technical teams

For those who want to skip the code and jump straight to testing, the Level Access Platform includes several out-of-the-box tools to support technical teams as they create and test code.

Test live with the Browser Extension

Get instant feedback on your latest product or website updates with the Level Access Browser Extension. Whether you're testing a pre-production site, secure environment, or even code run locally, the Browser Extension gives you immediate insight on the accessibility of your page or user flow. You can even store test results in the platform to prioritize findings and share them with your team.

User flow testing made simple with Automated Flows

Build confidence in your testing with Automated Flows. Use Automated Flows to test key user flows, interactive elements, dynamically generated content, and even single-page experiences from within the Level Access Platform without any time-consuming scripting or custom code.

Component Testing

Accelerate improvements to your digital experience by fixing multiple issues at once with Component Testing. Define key components, start testing, and instantly access a list of duplicate or repeat issues you can prioritize to make the maximum impact on your end users' experience.

Code-level reporting

Find issues in your code faster with code-specific results in the scan report. Every time an issue is discovered through automated testing, the Level Access Platform automatically captures the XPath or CSS selector and the HTML element to ensure every developer has a precise understanding of where an issue is located and how to fix it.
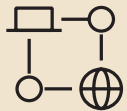

Support for the entire workflow

While tools built for developers are essential, support shouldn't stop there. The full Level Access solution also includes numerous learning and workflow tools to help developers address accessibility more efficiently and effectively.

Role-specific learning with Academy

Learn practical skills you can apply every day with the developer learning path in Access Academy. This flexible, on-demand curriculum is designed specifically to equip developers with the knowledge and skills necessary to start writing accessible code right away.

Seamless workflow integration

Work seamlessly between the Level Access Platform and your issue tracking platform of choice with our bi-directional issue tracking integrations. These native integrations with platforms like Jira and Azure DevOps enable your teams to push accessibility findings directly from the Level Access Platform into existing development workflows.

The Level Access digital accessibility solution equips teams with the tools, training, and resources needed to proactively address accessibility at every stage of the digital experience creation life cycle.
